

Pathological Mechanisms of Alpha-Synuclein

Abstract

This study investigates the aggregation of alpha-synuclein in felines. We observed significant neural recovery. The presence of Beta-amyloid plaques was also noted.

Key Findings

1. Sleep patterns directly affect Tau phosphorylation.
2. High-protein diets (20% increase) improve memory.
3. Incubation at 37 degrees Celsius is optimal.

Materials and Methods

Samples were treated with 50 micrograms/mL of PFFs.
Incubation period: 120 hours in a controlled environment.
